

IN THE CLAIMS:

Please withdraw claims 7-9 for being drawn to a non-elected invention.

Please amend the claims as follow:

1. (Original) A kelly bushing, comprising:

a base with a tubular channel therethrough from top to bottom, the base having a plurality of base axle slots,

a roller support on the base, the roller support with a plurality of roller support axle slots,

each axle with a portion movably positioned in a corresponding roller support axle slot of the roller support so that movement of an axle therein moves its corresponding roller with respect to the tubular channel,

each axle with a portion movably positioned in a corresponding base axle slots of the base so that movement of an axle therein moves its corresponding roller with respect to the tubular channel,

a leveling bar at the top of the roller support, the roller support movable vertically by moving the leveling bar, and

the base axle slots at an angle to the roller support axle slots so that movement of the leveling bar effects movement of the base axle slots with respect to the roller support thereby moving the rollers with respect to the tubular channel into and out of contact with a kelly within the tubular channel.

2. (Original) The kelly bushing of claim 1, further comprising:

a plurality of spaced-apart guide rods extending upwardly from the base and through openings in the leveling bar to guide movement of the leveling bar with respect to the base thereby guiding movement of the rollers.

3. (Original) A kelly bushing, comprising:
 - a body with a tubular channel therethrough from top to bottom, and
 - a plurality of rollers connected to the body and spaced-apart around the bottom of the body, each roller with a portion projecting into the tubular channel for contacting flats of a kelly projecting through the body.
4. (Original) The kelly bushing of claim 3, wherein the kelly bushing is positionable on a rig floor with the rollers beneath the rig floor.
5. (Original) A kelly bushing, comprising:
 - a body, the body having an opening therethrough for the passage of tubulars through the kelly bushing,
 - roller apparatus connected to the body for facilitating tubular movement through the body, and
 - the opening sufficiently large so that a kelly, tool joints and drill pipe are movable therethrough, the kelly having a hex part and a tool joint part.
6. (Original) A kelly bushing, comprising:
 - a body with a tubular channel therethrough from top to bottom,
 - a plurality of rollers connected to the body and spaced-apart around the body, each roller with a portion projecting into the tubular channel for contacting flats of parts of a kelly projecting through the body, and
 - the body comprising two selectively separable halves releasably joined together.
7. (Withdrawn) A kelly, comprising:
 - a tubular body with a top and bottom, and
 - a flats tubular with a top and a bottom, the top of the body formed of or secured to the bottom of the flats tubular, the flats portion having a plurality of flat surfaces around circumference of the flats tubular,

Patents
Atty. Dkt. WEAT/0142.D2

at least one tool joint having a top and a bottom, the top of the at least one tool joint connected to the bottom of the tubular body, the tool joint having an outer diameter, and

a diameter of the flats across a cross-section of the flats tubular from one flat surface to an opposing flat surface at least as large as the outer diameter of the at least one tool joint.

8. (Withdrawn) A kelly, comprising:

a tubular body with a top and a bottom,

a flats tubular with a top and a bottom, the top of the body formed of or secured to the bottom of the flats tubular, the flats portion having a plurality of flat surfaces around a circumference of the flats tubular,

a tool joint having a top and a bottom, the top of the tool joint connected to the bottom of the tubular body, and

the tubular body between about five feet and about ten feet in length.

9. (Withdrawn) The kelly of claim 8, wherein the tubular body is about six feet long.

Please add the following claims:

10. (New) An apparatus for use with a downhole tool, comprising:

a torque transmission member coupled to the downhole tool; and

a bushing, the bushing having:

a body;

a channel extending through the body for receiving the torque transmission member; and

a plurality of rollers coupled to the body, the plurality of rollers adapted to engage the torque transmission member.

11. (New) A kelly bushing for engaging a kelly, comprising:
a body;
a channel extending through the body for receiving the kelly; and
a plurality of rollers coupled to the body, the plurality of rollers adapted to engage the kelly.
12. (New) The kelly bushing of claim 11, wherein the plurality of rollers comprises a profile for engaging the kelly.
13. (New) The kelly bushing of claim 12, wherein the profile is adapted to transmit torque to the kelly.
14. (New) The kelly bushing of claim 11, wherein the kelly bushing is coupled to a rotary table.
15. (New) The kelly bushing of claim 11, wherein the plurality of rollers are radially movable to engage or disengage from the kelly.
16. (New) An apparatus for use with a downhole tool, comprising:
a kelly coupled to the downhole tool; and
a kelly bushing, the kelly bushing having:
a body;
a channel extending through the body for receiving the kelly; and
a plurality of rollers coupled to the body, the plurality of rollers adapted to engage the kelly.
17. (New) The apparatus of claim 16, further comprising a rotary table for rotating the kelly bushing.

18. (New) The apparatus of claim 17, wherein torque generated by the rotary table is transmitted to the kelly through the kelly bushing.
19. (New) The apparatus of claim 16, wherein the plurality of rollers comprises a profile for engaging the kelly.
20. (New) The apparatus of claim 19, wherein the kelly comprises a complementary profile for mating with the profile of the plurality of rollers.
21. (New) The apparatus of claim 16, wherein the downhole tool comprises a wellbore tubular.
22. (New) The apparatus of claim 21, wherein the wellbore tubular is selected from the group consisting of a drill pipe, a tool joint, and combinations thereof.
23. (New) The apparatus of claim 16, wherein a diameter of the kelly is larger than a diameter of the downhole tool.
24. (New) The apparatus of claim 16, wherein the kelly comprises a tubular.
